About Cozmo AI

Cozmo AI is the AI operating system for property claims. When a pipe bursts in someone's home at 2am, Cozmo's agents answer the call, capture the loss, enter the claim into Xactimate and Cotality, dispatch the right contractor against SLA, chase acceptances before breach, and draft the carrier-ready estimate from field photos. Cozmo runs both halves of a claims operation: everything the customer touches, and everything that happens behind the desk.

Customers are restoration franchisors, TPAs, and adjusting firms whose boards have told them to become AI-native and who have no way to do it themselves. The anchor customer is one of the largest restoration franchisors in the US. Backed by YCombinator (W25), Dubai Future District Fund, and global VCs. HQ in San Francisco.

About the Role

A claim is a hostile engineering environment. The data lives in Xactimate files, carrier portals, Zendesk queues, voicemails, and photos of wet drywall. The workflows were designed twenty years ago and enforced by franchise agreements. SLAs are measured in minutes and breaches cost real money.

Your job is to walk into that environment, reason from first principles about what the system should be, then build agents that run it in production. You spend part of your time inside customer operations, part of it writing code that becomes the platform. The distance between 'I saw a dispatcher waste an hour on this' and 'an agent now does it' should be days — and you own the whole distance. You report to the CTO and work directly with both founders.

Cozmo works almost six days a week, in person in New York — 9am to 9pm (996 schedule) — and go-live weeks take the seventh day too. This is stated plainly because intensity is the structural advantage against incumbents with a hundred times the headcount. The engineers Cozmo wants read this and relax.

What You'll Do

- Deploy into enterprise claims operations and own technical outcomes end to end
- Build production agent systems: prompt architectures, tool use, routing, evals, fallbacks, and the glue between LLMs and systems that were never meant to have APIs
- Reverse engineer legacy claims software (Xactimate, Cotality, carrier portals) and make it programmable
- Design the data layer as you go — every claim generates hundreds of structured data points, and the pipelines you build become the moat
- Ship during live go-lives with hard dates and executives watching, including hurricane season surges where volume triples overnight

- Convert field solutions into platform primitives so each deployment is faster than the last

| Requirements

Must-Have

- Exceptional CS fundamentals from a top programme, or the self-taught equivalent with proof — Cozmo tests the calibre of thinking directly
- 0–4 years of experience; new grads welcome if the work says more than the resume
- Builds fast and deep: strong in Python or TypeScript, comfortable across the stack, able to go from empty repo to production system alone
- Hands-on LLM engineering: has built agent systems, written evals, and knows where models break — beyond calling an API in a notebook
- First-principles reasoning: when the standard workflow is wrong, notices it and can defend the redesign to the person who has run it for twenty years
- Evidence of ambition that can be inspected: research, a startup, open source, competition results, something shipped that people use
- Wants to be around customers — the best FDEs treat the deployment as the interesting part
- Committed to 996 in-office culture in New York (9am–9pm, 6 days/week) — go-live weeks take the seventh day; non-negotiable

Nice-to-Have

- Voice AI, telephony, or real-time systems experience
- Insurance, claims, or field services domain exposure
- Winning record in competitive programming, olympiads, or research

| Interview Process

1. Profile shortlist.
2. Takehome assignment.
3. Technical Discussion
4. Culture fit
5. Offer
